LETTER TO THE EDITOR

Response to the Letter to the Editor – “The PARADIGM-HF population may be very different from real-world heart failure patients”

Resposta à Carta ao Editor «A população do PARADIGM-HF pode ser muito diferente do mundo real dos doentes com insuficiência cardíaca»

To the Editor:

As highlighted by our analysis,¹ the epidemiological study in Lima² pertinentely quoted by Walter Calderón, and another two large registries,²,³ patients from randomized trials are frequently different from those found in our daily practice. However, the results of the PARADIGM-HF trial are changing and will continue to change the way we treat patients with heart failure and reduced ejection fraction.

Recently, the TRANSITION trial demonstrated the safety of sacubitril/valsartan when initiated prior to discharge from hospitalization for heart failure, achieving similar titration rates (62% vs. 68%),³ and PIONEER-HF showed that in-hospital initiation of sacubitril/valsartan further reduced NT-proBNP values (ratio of NT-proBNP at week 4 and 8 to baseline value: 0.53 vs. 0.75).⁴

Concluding, different pieces of an intricate puzzle are coming together, contributing to the widespread adoption of neuromodulation in patients with heart failure and reduced ejection fraction.

Conflicts of interest

The authors have no conflicts of interest to declare.
